                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C5a anaphylatoxin C-terminal analogue C5a(65-74) Tyr65 Pro71 D-Ala73
                                                                                                                                                                                                                                                                     region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type C11 or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (sep.
                                                                                                                                  C-terminal analogues of C5a anaphylatoxin · induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane permeability
                                                                                                                                                                                                                                                                                                                                                                                                                                            The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity CSa receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In a type (II or V) beta-turn specific human foetal artery smooth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; frug delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    muscle contraction assay, and a type III beta turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 122 and 48, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       constrained backbone conformation; proinflammatory response; spasmogenesis; platelet aggregation; neutrophil; non-mediated; mediated; increase; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment;
                                                                                                                                                                                                                                                     The present peptide is an analogue of a C-terminal decapeptide

Analogues with type creminal region) comprising a beta-turn. Analogues with type characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and ueutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.

The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune effects. They can also be used to facilitate drug delivery by
                                                                                                                                                                                                                                                                                                                                  C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microm) activities of 0.35 and 2.1, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or Lumours, and to develop high affinity CSa receptor antagonists useful as non-steroidal anti-inflammatory agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                        The present peptide is an analogue of a C-terminal decapeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

```
The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil elease and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C-terminal analogues of C5a anaphylatoxin - induce e.g.
spasmogenesis, platelet aggregation and increases in cell membrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In a type (II or'v) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microm) activities of 51.1 and 4.0, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal
spasmoyenesis; platelet aggregation; neutrophil; non-mediated; mediated; increase; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system; Alzhelmer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Taylor SM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sherman SA,

```
The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinf: ...matory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity CSa receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     smooth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  muscle contraction assay, and a type fII beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 1.13 and 5, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      anti-inflammatory agents.
In a type (11 or V) beta-turn specific human foetal artery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 8; Paye 78; 116pp; English.

increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal anti-inflammatory agents.

In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 3.7 and 2.5, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      constrained backbone conformation; proinflammatory response; spasmogenesis; platelet aggregation; neutrophil; non-mediated; mediated; increase; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment; immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.

                                                                                                                                                                                                                                                                                                                                       Gaps
                    (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.
                                                                                              The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C5a anaphylatoxin C-terminal analogue C5a(65-74) Tyr65 Pro71 Ala72.
                                                                                                                                                                                              In a type (II or V) beta-turn specific human foetal artery smooth mascle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 17.9 and 5.6, compared to 0.018 and 0.0013
backbone conformation (compared to the matural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type

```
region from human CSa anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible (c-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platclet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esperascular) permeability, respectively.

The analogues can be used as immune adjuvants for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of >1000 and 215, compared to 0.018 and 0.0013
                                                                      C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane permeability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develophigh affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              constrained backbone conformation; proinflammatory response. spasmogenesis: platelet aggregation; neutrophil; non-mediated; meraease; cell membrane; vascular: permeability; neutrophil polarisation; neutrophil enzyme release; Lrealment; immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; daug delivery; CNS disorder; central nervous system: Alzheimer's disease; Lumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C5a anaphylatoxin analogue C5a(65-74) Tyr65 Ala70 Pro71 D-Ala73

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                       The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type C-terminal region) comprising a beta-turn. Analogues with type C-terminal region) compressly, platelet aggregation and neutrophil on mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil mediated increases in cell membrane (esp. creases and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively. The analogues can be used as immune adjuvants for the treatment of timmune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by allocating and plate and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                              C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In a type (II or'v) beta-turn specific human foetal artery smooth mustle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 0.33 and 2.3, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal anti-inflammatory agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immune adjuvant; Immunodeficiency; augmentation; immune therapy;

```
The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible (C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the poptide and respective ECSO (microM) activities of 1.74 and 15.8, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

clior V) and type III beta-turns elicit proinfigamatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme reclease and neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The analogues can be used as immune adjuvants for the treatment of immune deliciency disorders, and for augmenting standard immune thicknessy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5s receptor antagonists useful as non-steroidal anti-inflammatory agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C-terminal analogues of C5a anaphylatoxin · induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 2.04 and 19.5, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting binding of the molecular adjuvant to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the APC immunogen to an antigen presenting pathway of the APC. The present connected to an immune response for protecting adjuvant can be used to produce an immune response for protecting adjuvant can be used to pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immune agents. The molecular adjuvant is readily taken up and provide for the production of antibodies for use as immunodiagnostic and immune production of antibodies for use as immunodiagnostic and provide for the production of antibodies adjainst a weakly-antigenic or non-antigenic substances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

             RESULT
                                                          response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence represents a specifically claimed formula for a molecular adjuvant, where the immunogen is serum amyloid A. The molecular and other pathogens or to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC-mediated immune responses. It can provide for the production of antibodies against a weakly-antigenic or

The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence represents a targeting ligand and immunogen, in which the juxta-membrane epitope of human mucin-1 is positioned toward the amino carboxy terminus and the Cas analogue is positioned toward the amino carboxy terminus and the Cas analogue is positioned toward the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     terminus. The molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC-mediated immune responses. It can provide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

C5a anaphylatoxin analogue C5a(65-74) Tyr65 Gly69 Pro70.
                              17-OCT-1996 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen prosenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence represents a specifically claimed targeting ligand and immunogen to molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiaynostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed to the production of antibodies against a weakly-antigenic or
                                                                                                                                                                                                                                                                               Molecular adjuvant; immune response; immunogen; binding affinity; antigen presenting cell; APC; viral pathogen; anti tumour response; antibody; immunodiagnostic; immunotherapeutic; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Molecular adjuvants for enhancing immune responses - comprise an immunogen linked to a ligand having binding affinity for a determinant of an antigen presenting cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 19;

Analogues with Hype C-terminal region) comprising a beta-turn. Analogues with Hype (II or V) and type III beta-turns elicit prointlammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vascular) permeability respectively.
The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by disorders such as Alzheimer's disease or tumours, and to developing high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C-ferminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anti-inflammatory agents.
In a type (II or V) beta-turn specific human foetal artery smooth

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

*Molecular cloning and DNA sequencing of the Staphylococcus aureus UDP-N-acetylmuramyl tripeptide synthetase (murE) gene, essential for the optimal expression of methicillin resistance."; Microb. Drug Resist. 4:85-90(1998).

-!- FUNCTION: INCREASES THE FORMATION OF RIBOSOMAL TERMINATION COMPLEXES AND STIMULATES ACTIVITIES OF RF-1 AND RF-2. IT BINDS GUANINE NUCLEOTIDES AND HAS STRONG PREFERENCE FOR UGA STOP CODONS. IT MAY INTERACT DIRECTLY WITH THE RIBOSOME. THE STIMULATION OF RP-1 AND RF-2 IS SIGNIFICANTLY REDUCED BY GTP AND GDP, BUT NOT BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ŗ.

Biol. 4:833-838(1997).

FUNCTION: MEDIATES ATTACHMENT OF STAPHYOCOCCAL CELLS TO COLLAGEN-CONTRINING SUBSTRATA.

SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. CELL WALL.

SINILARITY: TO OTHER STREPTOCOCCAL AND STAPHYLOCOCCAL PROTEINS IN THE REGION OF THE MEMBRANE ANCHOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS) OF 169-318.

Gene 171:265-269(1996);

IL Gene 171:265-269(1996);

Y-CELL-RECEPTOR-MEDIATED TRANS ACTIVATION OF HIV-2 GENE

EXPRESSION. BINDS SPECIFICALLY TO TWO PURINE-RICH MOTTES IN THE

HIV-2 ENHANCERE. ELF-1 BINDS TO THE UNDERPHOSPHORYLATED FORM OF RB.

MAY INTERACT WITH OTHER TRANSCRIPTION FACTORS IN ORDER TO REGULATE

SPECIFIC GENES (BY SIMILARITY).

1. SUBCELLULAR LOCATION: NUCLEAR.

2. TISSUE SPECIFIC GELLS.

DETECTED IN OTHER CELL TYPES SUCH AS FIBROBLASTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 10, A

Sequence 10, Application US/08985126
Patent No. 594259
GENERAL INFORMATION:
APPLICANT: Sanderson, Sam D.
APPLICANT: Sherman, Simon A.
APPLICANT: Taylor, Stephen M.
TITLE OF INVENTION: High Affinity Response-Selective
TITLE OF INVENTION: C-Terminal Analogs of C5a Anaphylatoxin NUMBER OF SEQUENCES: 37
CORRESPONDENCE ADDRESS:

                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                  response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen and so binding of the molecular adjuvant to the APC; determinant activates the APC, effecting delivery of the APC; timmunogen to an antigen presenting pathway of the APC. The present sequence represents a specifically claimed targeting ligand, which is a C5a C-terminal decapeptide agonist. The molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumur responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and provide for the production of antibodies against a weakly-antigenic or non-antigenic substances.

Targana, maying untuing attituty to a characteristic decomposition of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to limber determinant activates the APC, effecting delivery of the person immunogen presenting pathway of the APC. The present sequence represents a specifically claimed formula for a molecular adjuvant, where the immunogen is serum amyloid A. The molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC-mediated immune responses. It can provide for the production of antibodies against a weakly-antigenic or
                                                                                                                                                                                                                   A novel molecular adjuvant has been developed for enhancing an immune response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antigen presenting cell; APC; viral pathogen; anti tumour response; antibody; immunodiagnostic; immunotherapeutic; agonist.
